# BECOME A **veneER MATCHING** EXPERT

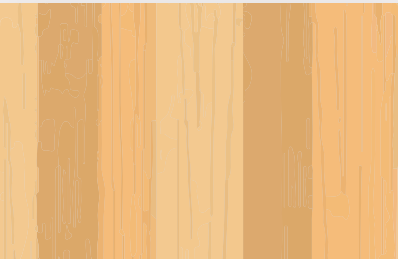

## BOOK MATCH

The most common type of matching, Book Match occurs when identical leaves are taken from a bundle of veneer, and every other leaf is flipped over. In essence, you are creating a mirrored image of the veneer in to create a balanced look.

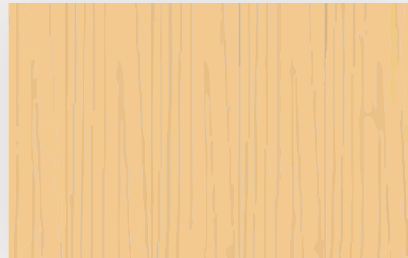

## RANDOM MATCH

A Random Match occurs when veneer leaves from different bundles are used to construct a face. The veneer leaves taken may have different grain widths and variations. This is typically done if a veneer has a unique character or you're looking for a rustic appearance.

## SLIP MATCH

A Slip Match occurs when the leaves are laid up in the same orientation, without being flipped. This is used primarily when a veneer does not have a prominent grain feature, is lightly figured, or is a straight cut. The result of a Slip Match is a more linear appearance without showing much visual grain matching.
